Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplifted by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro	was generated by immunising mice with N/erbB-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas	ignated e23(Fv), which binds	Example 8; Columns 25-28; 28pp; English. The present cDNA sequence codes for a claimed single-chain antibody,		labels or cytotoxin, useful for detection and treatment of tumour	W15185.	64831/06.	Bird RE. Kasnrzyk PG. King CR.                                                                                                                                                                                             P-PBDB; R94020.

Inhibition of proliferation or survival of, esp. malignant erbB2, cells by introducing nucleic acid mol. encoding antibody homologue which is expressed and binds, pref. erbB2, protein intracellularly Claim 42; Page 29-30; 48pp; English.

A nucleic acid comprises a first sequence encoding a signal peptide (R94019) linked to a second sequence (T17728) encoding a single chain Fv fragment (R94020) that binds a human erbB2 oncoprotein. The anti-erbB2 sFv portion is obtained by PGR using e23scFv plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody homologue within e.g. an epithelial carcinoma cell. Intracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T17728

The source of human erbB-2 protein for the prodn. of antibodies n 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

Example 2; Fig 2A; 102pp; English.
A cDNA clone (T34542) codes for the heavy chain variable region
(R99687) of monoclonal anti-idiotype antibody 3H1 (ATCC HB 12003
It was obtd. by PCR amplification (see also T34543-44) of cDNA
derived from 3H1 hybridoma cells. Anti-idiotype antibody 3H1
elicits a specific immune response to a unique epitope of
carcinoembryonic antigen (CEA) that is not present on other
members of the CEA family or on normal adult tissues. 3H1
can be used as a vaccine to elicit immune responses in pattents
with advanced CEA-associated disease or, when labeled, to enhanc
                                                                                                                                                                                                                                                                                                     tumour detection in imaging.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PT Recombinant monoclonal anti-idiotype antibody 3H1 sequences - used to develop prods for the detection and treatment of carcinoembryonic antigen-associated diseases, partic. cancers PS Claim 6; Fig 2A; 121pp; English.

CR A CDNA clone (T31541) codes for the heavy chain variable region (VM) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody that mimics a specific epitope of the 180,000 mol.wt.

CC carcinoembryonic antigen (CEA) and which elicits an immune response in patients with advanced CEA-associated disease, e.g. colorectal cancer. It was obtd. by PCR amplification of 3H1 hybridoma DNA (see also T31545-46). The isolated polynucleotide, and/or a polynucleotide (see also T31540) coding for the VL region (R98410) cof 3H1 can be used to design probes and primers, in expression cystems, and in pharmaceutical applns, including vaccines, gene thorapy and genetic immunisation, partic. against cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of anti-idiotype antibody 3H1 - for delaying development of carcinoembryonic antigen associated tumours

PS Disclosure; Page 39; 66pp; English.

This cDNA sequence includes a coding region for the heavy chain variable region (VH) (see W26729) of murine monoclonal anti-idiotype antibody 3H1. A cDNA sequence (see T99434) for the VL region (see W26728) is also provided. These clones can be utilised in the recombinant production of 3H1 polypeptides. 3H1 induces a specific immune response against a distinct and specific epitope of carcinoembryonic antigen (CEA), a tumour-associated antigen. The invention provides methods of delaying development of CEA-associated tumours using 3H1, particularly in high-risk individuals. The method can be used to delay the development of a variety of tumours, other adenocarcinomas such as those of the breast and lung, and biliary cancer, and gynaecological cancers.

Table 6; Page 57; 151pp; English.

The sequences given in Q43842-43 encode the light and heavy chains, respectively, of the chimeric antibody 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods.

The sequences given in Q43846-48 represent the expression vectors capH4625, pAH4807 and pAH4808. These vectors represent the cloning pAH4808. These vectors represent the cloning of the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 respectively, with the variable region of the murine monoclonal cantibody 128.1. These plasmids each encode a chimeric monoclonal cantibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CH1, CH2 and CH3 are derived from a control of the man source. These vectors in combination with the chimeric light chain vector, pAG4611 (see also Q43845), were transfected into SP2/OC cells and clones were isolated. Antibody analysis using biosynthe-citically labelled proteins, immunoprecipitation and SDS-PAGE indicated appropriate bands for the heavy and light chains as well as the cassembled antibody for the gamma-3 and gamma-4 chimeras. No detectable protein was isolated for the gamma-2 transfectants. 128.1 is an anti-cus assembled antibody for the gamma-2 transfectants. 128.1 is an anti-cus assembled in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent concerns and Alrheimers disease. It may also be used for diagnostic seguines of the paramatic constants and all the configurations and the prevent of the paramatic constants. This and all the proteins are also be used to treat or prevent concerns and all primers of the proteins and the proteins are constant through all the proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              οy
The sequences given in 04386.48 represent the expression vectors pAH4625, pAH4807 and pAH4808. These vectors represent the cloning of the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 respectively, with the variable region of the murine monoclonal antibody 128.1. These plasmids each encode a chimeric monoclonal cantibody in which the heavy chain (VH) is derived from a murine course and the sequences encoding CH1, CH2 and CH3 are derived from a human source. These vectors in combination with the chimeric light chain vector, pAG4611 (see also 043845), were transfected into SP2/0 cells and clones were isolated. Antibody analysis using biosynthetically labelled proteins, immunoprecipitation and SDS-PAGE indicated appropriate bands for the heavy and light chains as well as the casembled antibody for the gamma-3 and gamma-4 chimeras. No detectable protein was isolated for the gamma-2 transfectants. 128.1 is an anti-
cused in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent conceptor and disorders eg. brain tumours, AIDS, stroke, epilepsy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q43848;

Transcription of the VH gene is from the VH promoter of the murine 27.44 gene. The vector also includes a heavy chain immunoglobulin enhancer and the human gammal constant region (CH). The VH region of 128.1 was isolated by polymerase chain reaction and cloned into plasmid pAH4274. This was achieved by digesting the plasmid and the product with EcoRV and NheI. The VH gene was inserted in frame with the human gammal CH region CH at the 3' end of the VH-J region by means of a NheI site. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, parkingons and alzheimers disease.

Control of the sequences given in Q43846-48 represent the expression vectors copal4625, pAH4807 and pAH4808. These vectors represent the cloning control of the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 crespectively, with the variable region of the murine monoclonal control of the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 crespectively, with the variable region of the murine monoclonal control of the feavy chain (VH) is derived from a murine control of the murine monoclonal control of the passes and the sequences encoding CH1. CH2 and CH3 are derived from control of the sequences encoding CH2. CH3 and CH3 are derived from control of the gamma-1 of the chimeric light chain vector, pAG4611 (see also Q43845), were transfected into Sp2/0 colls and clones were isolated. Antibody analysis using biosynthe-control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-1 can into spatial control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimeras. No detectable control of the gamma-3 and gamma-4 chimera

                                                                                                                                                     the Ab heavy and light chain variable region-encoding CDNA isolated from hybridomas producing a mouse or rat monoclonal Ab reacting with the ganglioside GM2 respectively into an expression vector for use in animal cells which contains the human Ab heavy and light chain constant region-encoding cDNA. The expression vectors are introduced into animal cells and the transformant thus obtained is cultured for the prodn. of a chimeric human Ab reacting with the ganglioside GM2. In contrast to mouse monoclonal Abs, the chimeric human Abs will not cause anti-mouse Ig Ab prodn. in the patient's body but show a prolonged blood half-life, with a reduced frequency of adverse effects, so that it can be expected to be superior to mouse monoclonal Abs in the efficacy in the treatment of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Monoclonal antibody; Ab; ganglioside GM2; chimera; chimeric antibody; expression vector; heavy; light; hypervariable region; CDR; constant region; hyperdoning; immunoglobulin; KM-796; KM-750; KM-603; cancer;

                                                                                                                                                                                                                                                                                                         Disclosure; Page 14; 18pp; Japanese.

The sequences given in Q28522-23 encode fragments which were used in the construction of an agent for the treating and prevention of hypercalcaemia. The agent contained a portion of the antihuman parathyroid hormone-related protein monoclonal antibody (antihuman PTHrP MAb). The MAb was used as the active component in the agent. The agent further comprises a rodent/human chimeric MAb which has a rodent variable region and a human constant region and recognises
